

Math Medic Unit 1: Collecting Data

Lesson	Learning Targets
1.1 Introduction to Statistics	<ul style="list-style-type: none">• Understand the four components of the statistical investigative process.
1.2 Sampling Methods	<ul style="list-style-type: none">• Understand how convenience samples and voluntary response samples can lead to bias.• Understand how a random sample allows generalizations to a larger population.
1.3 Avoiding Bias	<ul style="list-style-type: none">• Understand how undercoverage and nonresponse can lead to bias.• Identify the conditions that can lead to response bias.
1.4 Observational Studies vs. Experiments	<ul style="list-style-type: none">• Explain why a confounding variable can make it difficult to conclude a cause-and-effect relationship between two variables.• Understand the difference between an observational study and an experiment.
1.5 Setting Up a Good Experiment	<ul style="list-style-type: none">• Understand the four principles of good experimental design.• Understand how random assignment allows for cause-and-effect conclusions.
1.6 Making Conclusions	<ul style="list-style-type: none">• Explain the purpose of selecting a random sample.• Explain the purpose of using random assignment in an experiment.
1.7 Statistical Significance	<ul style="list-style-type: none">• Understand what it means for results to be statistically significant.• Use simulations to determine if the results from an experiment are statistically significant.

Math Medic Unit 2: Visualizing Data for One Variable

Lesson	Learning Targets
2.1 Graphs for Categorical Data	<ul style="list-style-type: none">• Use bar graphs and pie charts to analyze data for one categorical variable.• Be aware of misleading graphs.
2.2 Dotplots for Quantitative Data	<ul style="list-style-type: none">• Use dotplots to analyze quantitative data.• Describe the distribution of a quantitative variable (shape, outliers, center, variability).
2.3 Histograms for Quantitative Data	<ul style="list-style-type: none">• Use histograms to analyze quantitative data.• Compare two or more distributions of a quantitative variable (shape, outliers, center, variability).
2.4 Measures of Center	<ul style="list-style-type: none">• Calculate and interpret the median and mean for a distribution of quantitative data.• Choose the most appropriate measure of center based on the shape of a distribution.
2.5 Measures of Variability	<ul style="list-style-type: none">• Calculate and interpret the interquartile range and standard deviation for a distribution of quantitative data.• Choose the most appropriate measure of variability based on the shape of a distribution.
2.6 Outliers for Quantitative Data	<ul style="list-style-type: none">• Identify outliers in a quantitative data set.• Use boxplots to analyze quantitative data.

Math Medic Unit 3: Analyzing Data for One Variable

Lesson	Learning Targets
3.1 Standardizing with z-scores	<ul style="list-style-type: none">• Calculate and interpret percentiles for quantitative data.• Calculate and interpret z-scores for quantitative data.
3.2 Transforming Data	<ul style="list-style-type: none">• Determine what happens to a distribution of quantitative data when adding/subtracting a constant.• Determine what happens to a distribution of quantitative data when multiplying/dividing by a constant.• Identify the mean and standard deviation of a distribution of z-scores.
3.3 Introducing the Normal Distribution	<ul style="list-style-type: none">• Model distributions of quantitative data using a density curve, including a normal distribution.• Use the shape of a density curve to compare the mean and median of the distribution.
3.4 Using the Empirical Rule	<ul style="list-style-type: none">• Construct a normal distribution for a data set using its mean and standard deviation.• Use the empirical rule (68-95-99.7) for normal distributions to estimate the percentage of values in an interval.• Use a simulation of many random samples to estimate margin of error.
3.5 Finding Area Under a Normal Distribution	<ul style="list-style-type: none">• Find the percent of a population above, below, or between values using a normal distribution.• Use a standard normal distribution to find population percentages.
3.6 Finding Boundary Values in a Normal Distribution	<ul style="list-style-type: none">• For a normal distribution, find the value corresponding to a given percentile.• Find the mean or standard deviation of a normal distribution given the value of a percentile.

Math Medic Unit 4: Exploring Data for Two Variables

Lesson	Learning Targets
4.1 Two-Way Tables	<ul style="list-style-type: none">• Use a two-way table to analyze data for two categorical variables.• Calculate and interpret joint, marginal, and conditional relative frequencies.
4.2 Exploring Two Categorical Variables	<ul style="list-style-type: none">• Construct and interpret segmented bar graphs to analyze two categorical variables.• Determine if there is an association between two categorical variables.
4.3 Exploring Two Quantitative Variables	<ul style="list-style-type: none">• Use a scatterplot to represent the relationship between two quantitative variables.• Describe the relationship between two quantitative variables (direction, unusual features, form, strength).
4.4 Correlation	<ul style="list-style-type: none">• Estimate and interpret the correlation (r) for two quantitative variables.• Understand that correlation does not imply causation.
4.5 Making Predictions	<ul style="list-style-type: none">• Use a linear regression model to make a prediction, being careful about extrapolation.• Calculate and interpret a residual.• Interpret the slope and y-intercept of a linear regression model.
4.6 Choosing a Good Model	<ul style="list-style-type: none">• Make predictions using linear and exponential models.• Use a residual plot to determine if a regression model is appropriate.
4.7 Multiple Regression	<ul style="list-style-type: none">• Understand multiple regression to model a response variable using more than one explanatory variable.• Use a multiple regression model with several explanatory variables to predict a value of the response variable.
Texas: Finding a Line of Best Fit	<ul style="list-style-type: none">• Transform a linear parent function to determine a line of best fit• Compare different linear models for the same set of data to determine best fit, including discussions about error.• Compare different methods for determining best fit, including median-median and absolute value.

Math Medic Unit 5: Understanding Probability

Lesson	Learning Targets
5.1 What is Probability?	<ul style="list-style-type: none">• Interpret probability as a long-run relative frequency.• Understand how the Law of Large Numbers relates to the idea of probability.
5.2 Rules for Probability	<ul style="list-style-type: none">• Use a sample space of equally likely outcomes to find probabilities.• Use notation and basic rules for probability.
5.3 General Addition Rule	<ul style="list-style-type: none">• Use two-way tables and Venn diagrams to find probabilities.• Use the general addition rule to calculate $P(A \text{ or } B)$ for events that are not mutually exclusive.
5.4 Conditional Probability	<ul style="list-style-type: none">• Calculate and interpret conditional probabilities.• Determine if two events are independent using conditional probabilities.
5.5 Independent Events	<ul style="list-style-type: none">• Calculate probabilities of joint independent events.• Determine if two events are independent using the multiplication rule for independent events.
5.6 General Multiplication Rule	<ul style="list-style-type: none">• Use the general multiplication rule to calculate $P(A \text{ and } B)$ for events that are dependent.• Use tree diagrams as a strategy to calculate probabilities.
5.7 Probability Using Permutations	<ul style="list-style-type: none">• Use the multiplication counting principle to calculate permutations.• Use permutations to compute probabilities.
5.8 Probability Using Combinations	<ul style="list-style-type: none">• Understand the difference between permutations and combinations.• Use combinations to compute probabilities.

Math Medic Unit 6: Analyzing Random Variables

Lesson	Learning Targets
6.1 Discrete Random Variables	<ul style="list-style-type: none">Analyze and interpret the probability distribution for a discrete random variable.Use a formula to calculate the mean of a discrete random variable.
6.2 Expected Value	<ul style="list-style-type: none">Use technology to find and interpret the mean and standard deviation of a discrete random variable.Compare expected values to make a decision.
6.3 Binomial Distributions	<ul style="list-style-type: none">Check conditions to determine if a random variable is binomial.Use the binomial formula to calculate probabilities.
6.4 Analyzing Binomial Distributions	<ul style="list-style-type: none">Use technology to calculate probabilities for a binomial distribution.Calculate and interpret the expected value and standard deviation of a binomial random variable.
6.5 Normal Approximation for Binomial Distributions	<ul style="list-style-type: none">Check the Large Counts condition when using a normal approximation for a binomial distribution.Use the normal approximation to estimate binomial probabilities.
Florida: Geometric Distributions	<ul style="list-style-type: none">Check conditions to determine if a random variable is geometric.Solve real-world problems involving geometric distributions.
Florida: Poisson Distributions	<ul style="list-style-type: none">Check conditions to determine if a random variable is Poisson.Solve real-world problems involving Poisson distributions.

Math Medic Unit 7: Sampling Distributions

Lesson	Learning Targets
7.1 Introduction to Sampling Distributions	<ul style="list-style-type: none">• Distinguish between a sample statistic and a population parameter and use appropriate notation for each.• Understand the concept of a sampling distribution.
7.2 Bias and Variability	<ul style="list-style-type: none">• Determine if an estimator is biased or unbiased.• Understand why increasing the sample size reduces the variability when estimating a population parameter.
7.3 Sample Proportions	<ul style="list-style-type: none">• Describe the shape, center, and variability of the sampling distribution of \hat{p}.• Find and interpret probabilities involving the sampling distribution of \hat{p}.
7.4 Sample Means	<ul style="list-style-type: none">• Describe the shape, center, and variability of the sampling distribution of \bar{x}.• Find and interpret probabilities involving the sampling distribution of \bar{x}.
7.5 Central Limit Theorem	<ul style="list-style-type: none">• Understand how the shape of the population distribution and the sample size impact the sampling distribution of \bar{x}.• Use the Central Limit Theorem to find and interpret probabilities involving the sampling distribution of \bar{x}.

Math Medic Unit 8: Making Inference for a Proportion

Lesson	Learning Targets
8.1 Introduction to Confidence Intervals	<ul style="list-style-type: none">• Use a point estimate and a margin of error to construct a confidence interval.• Interpret a confidence interval in context.
8.2 Margin of Error	<ul style="list-style-type: none">• Interpret a confidence level in context.• Understand how the margin of error is affected by the confidence level and sample size.
8.3 Setting Up a Confidence Interval for a Proportion	<ul style="list-style-type: none">• Check conditions for constructing a confidence interval for the population proportion, p.• Calculate and interpret a confidence interval for p.
8.4 Confidence Intervals for a Proportion	<ul style="list-style-type: none">• Use technology to construct and interpret a confidence interval for the population proportion, p.
8.5 Introduction to Significance Tests	<ul style="list-style-type: none">• Write hypotheses for a significance test for the population proportion, p.• Interpret a p-value and make a conclusion for a significance test for p.
8.6 Setting Up a Significance Test for a Proportion	<ul style="list-style-type: none">• Check conditions for a significance test for a population proportion.• Calculate a test statistic and p-value for a significance test for a population proportion.
8.7 Significance Tests for a Proportion	<ul style="list-style-type: none">• Perform a significance test for p.
8.8 Type I and Type II Errors	<ul style="list-style-type: none">• Describe a Type I and Type II error in context and explain the possible consequences of each.

Math Medic Unit 9: Making Inference for a Mean

Lesson	Learning Targets
9.1 Setting Up a Confidence Interval for a Mean	<ul style="list-style-type: none">• Check conditions for calculating a confidence interval for the population mean, μ.• Calculate and interpret a confidence interval for μ.
9.2 Confidence Intervals for a Mean	<ul style="list-style-type: none">• Use technology to construct and interpret a confidence interval for μ.
9.3 Setting Up a Significance Test for a Mean	<ul style="list-style-type: none">• Write hypotheses for a significance test for a population mean, μ.• Interpret a p-value and make a conclusion for a significance test for μ.
9.4 Significance Tests for a Mean	<ul style="list-style-type: none">• Use technology to perform a significance test for μ.• Understand the connection between significance tests and confidence intervals.
9.5 Confidence Intervals for Paired Data	<ul style="list-style-type: none">• Analyze the distribution of differences for a set of paired data using a graph and summary statistics.• Use technology to construct and interpret a confidence interval for the mean difference, μ_{diff}.
9.6 Significance Tests for Paired Data	<ul style="list-style-type: none">• Use technology to perform a significance test for a mean difference, μ_{diff}.

Math Medic Unit 10: Making Inference for Two Populations

Lesson	Learning Targets
10.1 Inference for Two Proportions	<ul style="list-style-type: none">• Visualize the sampling distribution of $\hat{p}_1 - \hat{p}_2$.• Check conditions for inference for the difference in population proportions, $p_1 - p_2$.
10.2 Confidence Intervals for Two Proportions	<ul style="list-style-type: none">• Use technology to construct and interpret a confidence interval for a difference in proportions, $p_1 - p_2$.
10.3 Significance Tests for Two Proportions	<ul style="list-style-type: none">• Write hypotheses for a significance test for the difference in population proportions, $p_1 - p_2$.• Use technology to perform a significance test for $p_1 - p_2$.
10.4 Inference for Two Means	<ul style="list-style-type: none">• Visualize the sampling distribution of $\bar{x}_1 - \bar{x}_2$.• Check conditions for inference for a difference in population means, $\mu_1 - \mu_2$.
10.5 Confidence Intervals for Two Means	<ul style="list-style-type: none">• Use technology to construct and interpret a confidence interval for a difference in means, $\mu_1 - \mu_2$.
10.6 Significance Tests for Two Means	<ul style="list-style-type: none">• Write hypotheses for a significance test for a difference in population means, $\mu_1 - \mu_2$.• Use technology to perform a significance test for $\mu_1 - \mu_2$.

Math Medic Unit 11: Investigating a Statistical Question

Lesson	Learning Targets
11.1 What is a Statistical Question?	<ul style="list-style-type: none">• Distinguish between statistical and non-statistical questions.
Intro Stats Final Project	<ul style="list-style-type: none">• Formulate statistical investigative questions that clearly identify variables and populations, and anticipate variability.• Design and evaluate methods of data collection including random sampling and experiments, accounting for bias and limitations.• Represent and summarize data using graphical displays and numerical measures to describe distributions.• Generalize from samples to populations, recognizing the impact of study design and variability on the scope of conclusions.
