

## 5 for 5! The Final Review!

True or False:

- 1) If  $g(x)$  is concave up, then using the tangent line at  $x = 3$  to approximate  $g(3.1)$  will produce an overestimate.
- 2) Selected values of the derivatives of a twice-differentiable function  $f(x)$  are shown in the table.

$f(x)$  has a relative minimum at  $x = 2$ .

$x$	0	1	2	3
$f'(x)$	5	-1	0	-2
$f''(x)$	1	3	4	-7

- 3) If  $g(x) = \int_3^{x^2} f(t)dt$ , then  $g'(x) = f(x^2)$ .
- 4) If a curve is increasing, then a left Riemann sum gives an overestimate of the area under a curve.
- 5)  $\int f'(7 - 2x)dx = -\frac{1}{2}f(7 - 2x) + C$
